February 19, **2014** Bumblebees infected with honeybee diseases

The beleaguered bumblebee faces a new threat, scientists say. Researchers have found that two diseases harboured by honeybees are spilling over into wild bumblebees. Insects infected with deformed wing virus and a fungal parasite called *Nosema ceranae* were found across England, Scotland and Wales. Writing in the journal Nature, the team says that beekeepers should keep their honeybees as free from disease as possible to stop the spread. “These pathogens are capable of infecting adult bumblebees and they seem to have quite significant impacts,” said Professor Mark Brown from Royal Holloway, University of London. Around the world, bumblebees are doing badly. In the last few decades, many species have suffered steep declines, and some, such as Cullem’s bumblebee (*Bombus cullumanus*) in the UK, have gone extinct. Scientists believe that the destruction of their habitats – particularly wildflower meadows – has driven much of this loss, but the latest research suggests that disease too could play a role.

April 11, **2014**- "Bee populations worldwide are threatened by pests, pesticides and extreme weather. At the University of Georgia's Horticulture Farm in Athens, scientists are studying ways to protect and support honey bee colonies. Jennifer Berry, lead researcher on the project, says a simple walk through the produce aisle at the grocery store shows why bees matter. "When you see all those fruits and vegetables -- all of that color -- they're there because of the hard work of honey bees," says Berry. "They provide the pollination that provides the color in our diet." Berry manages 300 bee hives on the Athens campus and works to keep bee populations healthy. But severe weather, invasive mites and the overuse of pesticides are threatening honey bee populations nationwide at an alarming rate; more than a third die every year. During our visit, we witnessed a bee being born. Berry quickly noticed the tiny bee's crumpled wings, evidence of varroa mites that won't allow this bee to survive." <http://www.weather.com/tv/tvshows/americas-morning-headquarters/bees-dying-rapid-rate-why-20140411>

May 8, **2014** - Purdue: Bees Dying by the Thousands

A silent killer is wiping out our area's honey bee population, and beekeepers hope something is done soon before it's too late. Perry and Beverly Riley have been beekeepers for 9 years. Since last summer, Perry has lost about 80-percent of his bees. He says last year's drought hurt, and then this past winter did in a number more. "They're already weak, and that just put the hammer to them," said Perry. As if bad weather weren't enough, beekeepers like the Riley's will tell you there's an even more dangerous bee killer out there: pesticides farmers use in their fields.

"They don't kill them all at once. It's a slow kill. They'll go in in the winter, and by spring they're dead," said Perry. Purdue University says bees are dying by the thousands. A dry spring means the pesticides can be wind blown onto plants like dandelions. When bees come to pollinate, they're in essence covered in poison, which they take back to their hives.

May 8, **2014** -Samples of a Dead Beehive Sent to USDA

A giant beehive was found dead in a backyard Santa Barbara house in February. The beehive had been there for over 11 years, but a few months ago residents found hundreds of the bees dead near the hive. "According to our Santa Barbara beekeeper member, she had seen quite a few bees had been struggling and twitching. She had a pretty good feeling that it was due to some sort of pesticide exposure," said Todd Bebee, president of Santa Barbara Beekeepers Association. Samples of the beehive were taken on Thursday and shipped to Penn State.

Maryann Frazier, country's leading entomologist, will research the case and will have results within three to four weeks. For now the beehive will stay at the Santa Barbara Museum; video of the once existing beehive can be seen inside the "Bee Cell".
